

AUCKLAND HARBOUR BRIDGE

WORK BEGAN this year on the Auckland Harbour Bridge, New Zealand.

This is the most important bridge project to be undertaken in the Southern Hemisphere since the completion by D.L. of the Sydney Harbour Bridge in 1932.

The cost of the Auckland Harbour Bridge, exclusive of approaches, is £3,465,000 and the work is being undertaken jointly by Dorman Long

(Bridge & Engineering) Ltd. and the Cleveland Bridge & Engineering Co. Ltd.

Designed to resist earthquake shocks, the overall length of the bridge works is 3,520 feet, including an 800 foot span 142 feet above the navigation channel and six other spans. The superstructure will be built in high tensile steel, requiring approx. 6,690 tons all of which will be rolled in Dorman Long mills on Tees-side.
